Linear Time Temporal Logic: Reasoning about computation paths:

 $\Diamond \varphi : \ \varphi$ is true some time in *the* future.

A. Pnuelli. A Temporal Logic of Programs. in Proc. 18th IEEE Symposium on Foundations of Computer Science (1977).

▲ロト ▲圖ト ▲画ト ▲画ト 三回 - のへで

Linear Time Temporal Logic: Reasoning about computation paths:

 $\Diamond \varphi : \varphi$ is true some time in *the* future.

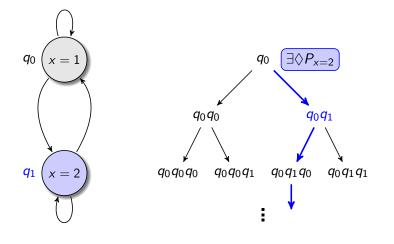

A. Pnuelli. A Temporal Logic of Programs. in Proc. 18th IEEE Symposium on Foundations of Computer Science (1977).

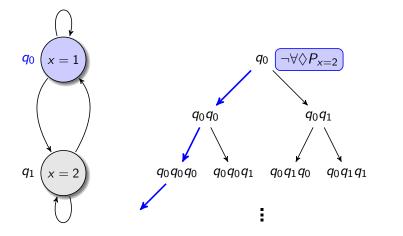

Branching Time Temporal Logic: Allows quantification over paths:

 $\exists \Diamond \varphi$: there is a path in which φ is eventually true.

E. M. Clarke and E. A. Emerson. *Design and Synthesis of Synchronization Skeletons using Branching-time Temproal-logic Specifications*. In *Proceedings Workshop on Logic of Programs*, LNCS (1981).

The previous model assumes there is *one* agent that "controls" the transition system.

▲ロト ▲圖ト ▲画ト ▲画ト 三回 - のへで

The previous model assumes there is *one* agent that "controls" the transition system.

What if there is more than one agent?

▲ロト ▲圖ト ▲画ト ▲画ト 三回 - のへで

The previous model assumes there is *one* agent that "controls" the transition system.

What if there is more than one agent?

Example: Suppose that there are two agents: a server (s) and a client (c). The client asks to set the value of x and the server can either grant or deny the request. Assume the agents make simultaneous moves.

→ 《冊》 《글》 《글》 _ 글 _

The previous model assumes there is *one* agent that "controls" the transition system.

What if there is more than one agent?

Example: Suppose that there are two agents: a server (s) and a client (c). The client asks to set the value of x and the server can either grant or deny the request. Assume the agents make simultaneous moves.

◆□ ▶ ◆□ ▶ ▲ □ ▶ ▲ □ ▶ ● ● ● ●

The previous model assumes there is *one* agent that "controls" the transition system.

What if there is more than one agent?

Example: Suppose that there are two agents: a server (s) and a client (c). The client asks to set the value of x and the server can either grant or deny the request. Assume the agents make simultaneous moves.

	deny	grant
set1		$q_0 \Rightarrow q_0, \; q_1 \Rightarrow q_0$
set2		$q_0 \Rightarrow q_1, \; q_1 \Rightarrow q_1$

The previous model assumes there is *one* agent that "controls" the transition system.

What if there is more than one agent?

Example: Suppose that there are two agents: a server (s) and a client (c). The client asks to set the value of x and the server can either grant or deny the request. Assume the agents make simultaneous moves.

$$\begin{array}{c|c} & deny & grant \\ \hline set1 & q \Rightarrow q & q_0 \Rightarrow q_0, \ q_1 \Rightarrow q_0 \\ set2 & q \Rightarrow q & q_0 \Rightarrow q_1, \ q_1 \Rightarrow q_1 \end{array}$$

From Temporal Logic to Strategy Logic

► Coalitional Logic: Reasoning about (local) group power.

 $[C]\varphi$: coalition C has a **joint action** to bring about φ .

M. Pauly. A Modal Logic for Coalition Powers in Games. Journal of Logic and Computation 12 (2002).

▲ロト ▲暦 ▶ ▲ 臣 ▶ ▲ 臣 ● のへで

From Temporal Logic to Strategy Logic

► Coalitional Logic: Reasoning about (local) group power.

 $[C]\varphi$: coalition *C* has a **joint action** to bring about φ .

M. Pauly. A Modal Logic for Coalition Powers in Games. Journal of Logic and Computation 12 (2002).

 Alternating-time Temporal Logic: Reasoning about (local and global) group power:

 $\langle\!\langle A \rangle\!\rangle \Box \varphi$: The coalition A has a **joint action** to ensure that φ will remain true.

R. Alur, T. Henzinger and O. Kupferman. *Alternating-time Temproal Logic*. *Jouranl of the ACM* (2002).

From worlds to sets and back

Lifting

Deriving $P_1 \gg P_2 \gg P_3 \gg \cdots \gg P_n$ x > y iff x and y differ in at least one P_i and the first P_i where this happens is one with $P_i x$ and $\neg P_i y$

F. Liu and D. De Jongh. Optimality, belief and preference. 2006.

Introduction, Motivation and Background

- \checkmark Basic Ingredients for a Logic of Rational Agency
- Lecture 3: Logics of Rational Agency and Social Interaction, Part I
- Lecture 4: Logics of Rational Agency and Social Interaction, Part II
- Lecture 5: Conclusions and General Issues

Once a semantics and language are fixed, then standard questions can be asked: eg. develop a proof theory, completeness, decidability, model checking.

▲ロト ▲圖ト ▲画ト ▲画ト 三回 - のへで

How should we compare the different logical systems?

• Embedding one logic in another:

How should we *compare* the different logical systems?

Embedding one logic in another: coalition logic is a fragment of ATL (tr([C]φ) = ⟨⟨C⟩⟩ ○ φ)

▲ロト ▲圖ト ▲画ト ▲画ト 三回 - のへで

How should we *compare* the different logical systems?

- Embedding one logic in another: coalition logic is a fragment of ATL (tr([C]φ) = ⟨⟨C⟩⟩ ○ φ)
- Compare different models for a fixed language:

How should we *compare* the different logical systems?

- Embedding one logic in another: coalition logic is a fragment of ATL (tr([C]φ) = ⟨⟨C⟩⟩ ○ φ)
- Compare different models for a fixed language:
 - Alternating-Time Temporal Logics: Three different semantics for the ATL language.

V. Goranko and W. Jamroga. *Comparing Semantics of Logics for Multiagent Systems*. KRA, 2004.

How should we merge the different logical systems?

How should we merge the different logical systems?

Combining logics is hard!

D. Gabbay, A. Kurucz, F. Wolter and M. Zakharyaschev. *Many Dimensional Modal Logics: Theory and Applications.* 2003.

▲ロト ▲圖ト ▲画ト ▲画ト 三回 - のへで

How should we merge the different logical systems?

Combining logics is hard!

D. Gabbay, A. Kurucz, F. Wolter and M. Zakharyaschev. *Many Dimensional Modal Logics: Theory and Applications.* 2003.

Theorem $\Box \varphi \leftrightarrow \varphi$ is provable in combinations of Epistemic Logics and PDL with certain "cross axioms" ($\Box[a]\varphi \leftrightarrow [a]\Box\varphi$) (and full substitution).

R. Schmidt and D. Tishkovsky. *On combinations of propositional dynamic logic and doxastic modal logics*. JOLLI, 2008.

Merging logics of rational agency

- Reasoning about information change (knowledge and time/actions)
- Knowledge, beliefs and certainty
- "Epistemizing" logics of action and ability: knowing how to achieve φ vs. knowing that you can achieve φ
- Entangling knowledge and preferences
- Planning/intentions (BDI)

Example

Ann would like Bob to attend her talk; however, she only wants Bob to attend if he is interested in the subject of her talk, not because he is just being polite.

There is a very simple procedure to solve Ann's problem: *have a* (*trusted*) friend tell Bob the time and subject of her talk.

Is this procedure correct?

イロト イ押ト イヨト イヨト ニヨー

Example

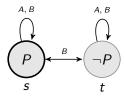

Ann would like Bob to attend her talk; however, she only wants Bob to attend if he is interested in the subject of her talk, not because he is just being polite.

There is a very simple procedure to solve Ann's problem: *have a* (*trusted*) friend tell Bob the time and subject of her talk.

Is this procedure correct? Yes, if

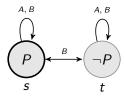

- 1. Ann knows about the talk.
- 2. Bob knows about the talk.
- 3. Ann knows that Bob knows about the talk.
- 4. Bob *does not* know that Ann knows that he knows about the talk.
- 5. And nothing else.

Example

P means "The talk is at 2PM".

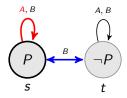

Example

P means "The talk is at 2PM".

 $\mathcal{M}, s \models K_A P \land \neg K_B P$

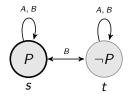

Example

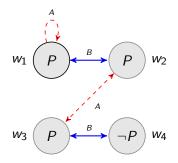

P means "The talk is at 2PM".

 $\mathcal{M}, s \models \mathbf{K}_{A}\mathbf{P} \land \neg \mathbf{K}_{B}\mathbf{P}$

Example

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □

History-based Frames

Definition

Let Σ be any set of events. A set $\mathcal{H} \subseteq \Sigma^* \cup \Sigma^{\omega}$ is called a protocol provided FinPre_{- ϵ}(\mathcal{H}) $\subseteq \mathcal{H}$. A rooted protocol is any set $\mathcal{H} \subseteq \Sigma^* \cup \Sigma^{\omega}$ where FinPre(\mathcal{H}) $\subseteq \mathcal{H}$.

▲ロト ▲圖ト ▲画ト ▲画ト 三回 - のへで

History-based Frames

Definition

Let Σ be any set of events. A set $\mathcal{H} \subseteq \Sigma^* \cup \Sigma^{\omega}$ is called a protocol provided FinPre_{- ϵ}(\mathcal{H}) $\subseteq \mathcal{H}$. A rooted protocol is any set $\mathcal{H} \subseteq \Sigma^* \cup \Sigma^{\omega}$ where FinPre(\mathcal{H}) $\subseteq \mathcal{H}$.

Definition

An ETL frame is a tuple $\langle \Sigma, \mathcal{H}, \{\sim_i\}_{i \in \mathcal{A}} \rangle$ where Σ is a (finite or infinite) set of events, \mathcal{H} is a protocol, and for each $i \in \mathcal{A}, \sim_i$ is an equivalence relation on the set of finite strings in \mathcal{H} .

◆ロ ▶ ◆母 ▶ ◆臣 ▶ ◆臣 ▶ ◆ ● ● ● ● ●

History-based Frames

Definition

Let Σ be any set of events. A set $\mathcal{H} \subseteq \Sigma^* \cup \Sigma^{\omega}$ is called a protocol provided FinPre_{- ϵ}(\mathcal{H}) $\subseteq \mathcal{H}$. A rooted protocol is any set $\mathcal{H} \subseteq \Sigma^* \cup \Sigma^{\omega}$ where FinPre(\mathcal{H}) $\subseteq \mathcal{H}$.

Definition

An ETL frame is a tuple $\langle \Sigma, \mathcal{H}, \{\sim_i\}_{i \in \mathcal{A}} \rangle$ where Σ is a (finite or infinite) set of events, \mathcal{H} is a protocol, and for each $i \in \mathcal{A}, \sim_i$ is an equivalence relation on the set of finite strings in \mathcal{H} .

Some assumptions:

- 1. If Σ is assumed to be finite, then we say that \mathcal{F} is **finitely** branching.
- 2. If \mathcal{H} is a rooted protocol, \mathcal{F} is a **tree frame**.

Formal Languages

- $P\varphi$ (φ is true *sometime* in the past),
- $F\varphi$ (φ is true *sometime* in the future),
- $Y\varphi$ (φ is true at *the* previous moment),
- $N\varphi$ (φ is true at *the* next moment),
- $N_e \varphi$ (φ is true after event e)
- $K_i \varphi$ (agent *i* knows φ) and
- $C_B \varphi$ (the group $B \subseteq \mathcal{A}$ commonly knows φ).

History-based Models

An ETL **model** is a structure $\langle \mathcal{H}, \{\sim_i\}_{i \in \mathcal{A}}, V \rangle$ where $\langle \mathcal{H}, \{\sim_i\}_{i \in \mathcal{A}} \rangle$ is an ETL frame and

 $V: \mathsf{At} \to 2^{\mathsf{finite}(\mathcal{H})}$ is a valuation function.

Formulas are interpreted at pairs H, t:

 $H,t\models\varphi$

▲ロト ▲圖ト ▲画ト ▲画ト 三回 - のへで

Truth in a Model

- ▶ $H, t \models P\varphi$ iff there exists $t' \leq t$ such that $H, t' \models \varphi$
- ▶ $H, t \models F \varphi$ iff there exists $t' \ge t$ such that $H, t' \models \varphi$
- $\blacktriangleright H, t \models N\varphi \text{ iff } H, t + 1 \models \varphi$
- $H, t \models Y \varphi$ iff t > 1 and $H, t 1 \models \varphi$
- ▶ $H, t \models K_i \varphi$ iff for each $H' \in \mathcal{H}$ and $m \ge 0$ if $H_t \sim_i H'_m$ then $H', m \models \varphi$
- ▶ $H, t \models C\varphi$ iff for each $H' \in \mathcal{H}$ and $m \ge 0$ if $H_t \sim_* H'_m$ then $H', m \models \varphi$.

where \sim_* is the reflexive transitive closure of the union of the \sim_i .

Returning to the Example

Ann would like Bob to attend her talk; however, she only wants Bob to attend if he is interested in the subject of her talk, not because he is just being polite.

There is a very simple procedure to solve Ann's problem: *have a* (*trusted*) friend tell Bob the time and subject of her talk.

Agent Oriented Properties:

- ▶ No Miracles: For all finite histories $H, H' \in \mathcal{H}$ and events $e \in \Sigma$ such that $He \in \mathcal{H}$ and $H'e \in \mathcal{H}$, if $H \sim_i H'$ then $He \sim_i H'e$.
- ▶ **Perfect Recall**: For all finite histories $H, H' \in \mathcal{H}$ and events $e \in \Sigma$ such that $He \in \mathcal{H}$ and $H'e \in \mathcal{H}$, if $He \sim_i H'e$ then $H \sim_i H'$.
- Synchronous: For all finite histories H, H' ∈ H, if H ~_i H' then len(H) = len(H').

Ideal Agents

Assume there are two agents

Theorem

The logic of ideal agents with respect to a language with common knowledge and future is highly undecidable (for example, by assuming perfect recall).
